LIVE CRICKET INTELLIGENCE

CricPredict

Understand the game beyond the scoreboard.

An AI-powered live cricket intelligence and prediction platform.

cricket-score-predictor.com

Prepared for the Cricketviz team · November 2026

THE PROBLEM

Cricket fans see the score. But do they understand the game?

1. What is a realistic final score?
2. How likely is the batting team to reach 200?
3. Has the batting team actually gained momentum?
4. How significant was that wicket?
5. How much did a dropped catch or missed run-out change the game?

SCOREBOARD · 17.0 OVERS

84/4

Final score	Reaches 200?	Momentum
?	?	?

A scoreboard reports what has happened. **Fans want to understand what happens next.**

THE SOLUTION

From score reporting to cricket intelligence

PREDICT

LIVE ON SITE

- Projected final score, with a range
- Wickets still to fall
- Next-over expectation
- Win probability in chases (heuristic estimate)

EXPLAIN

LIVE ON SITE

- Plain-English reading of each projection
- Drivers shown: run rate, wickets in hand, overs left, momentum
- Venue and pitch conditions
- Re-run at any match state to see how it moves

QUANTIFY

PROPOSED RESEARCH

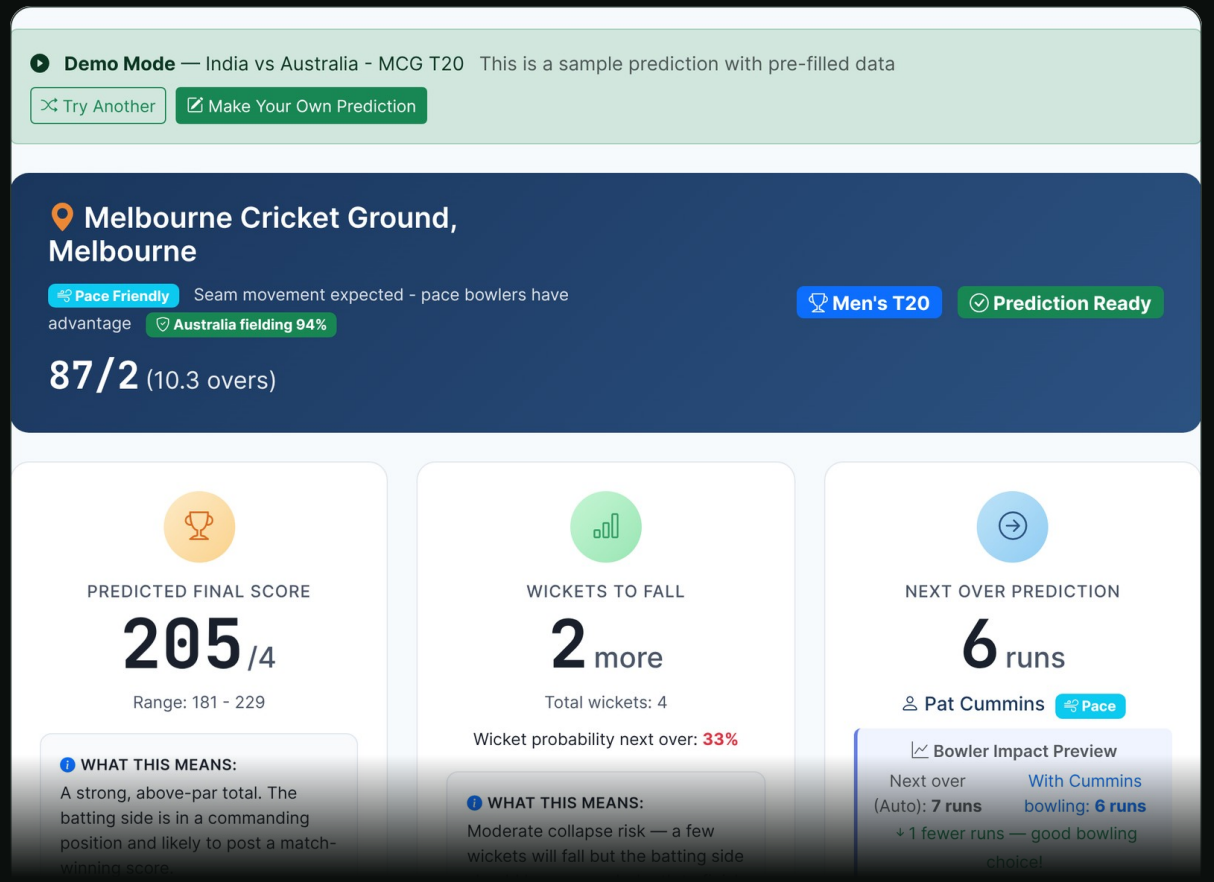

- Today: one fixed fielding rating per team
- Proposed: measure the effect of dropped catches, run-outs, misfields and runs saved
- Research tooling is built; it needs labelled event data

LIVE ON SITE = available in the product today. PROPOSED RESEARCH = experimental or planned; not part of the production prediction.

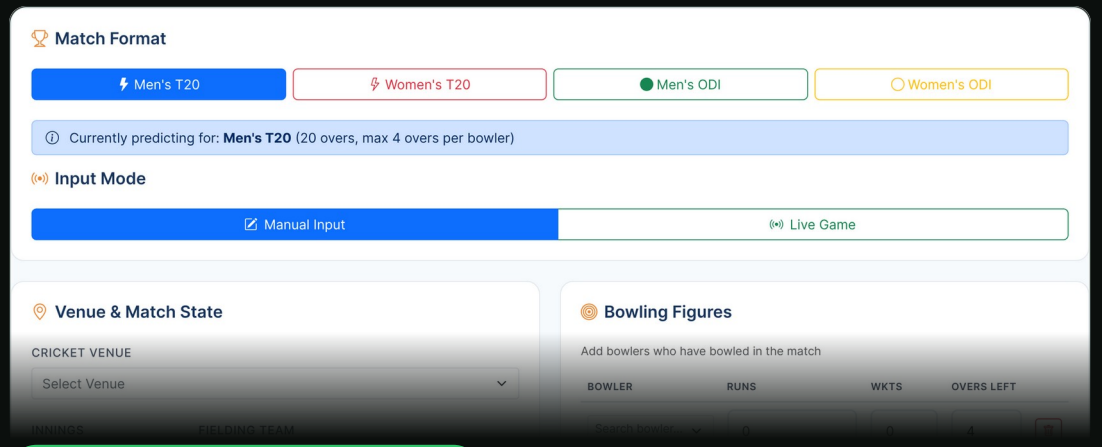

THE PRODUCT

A live intelligence layer for cricket

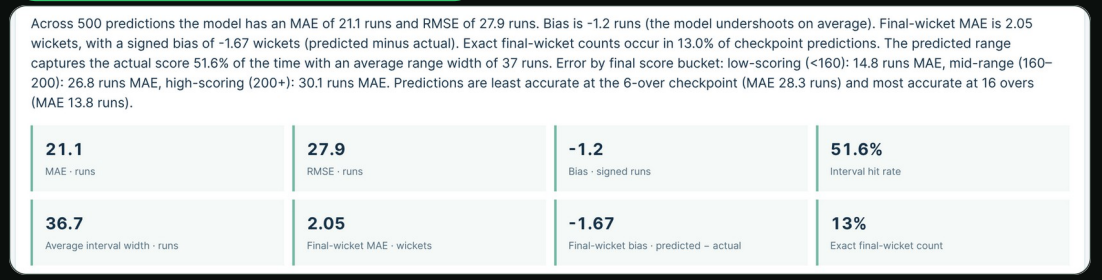

PREDICTION · SAMPLE SCENARIO

MATCH INPUT

BACKTEST REPORT · MEN'S T20

Also in the product: pre-match insights, live match insights, analytics, and Pro (saved predictions, match alerts).

Screenshots: current build, run locally. The prediction shown is the app's built-in sample scenario (India vs Australia, MCG T20), not a live match.

A REAL PREDICTION · NEW ZEALAND VS INDIA, ODI

Predictions that evolve with the game

AT 17.0 OVERS — **84/4**

Predicted final score

199

Range 170 – 228

AT 37.3 OVERS — **171/9**

Predicted final score

183

Revised after five more wickets

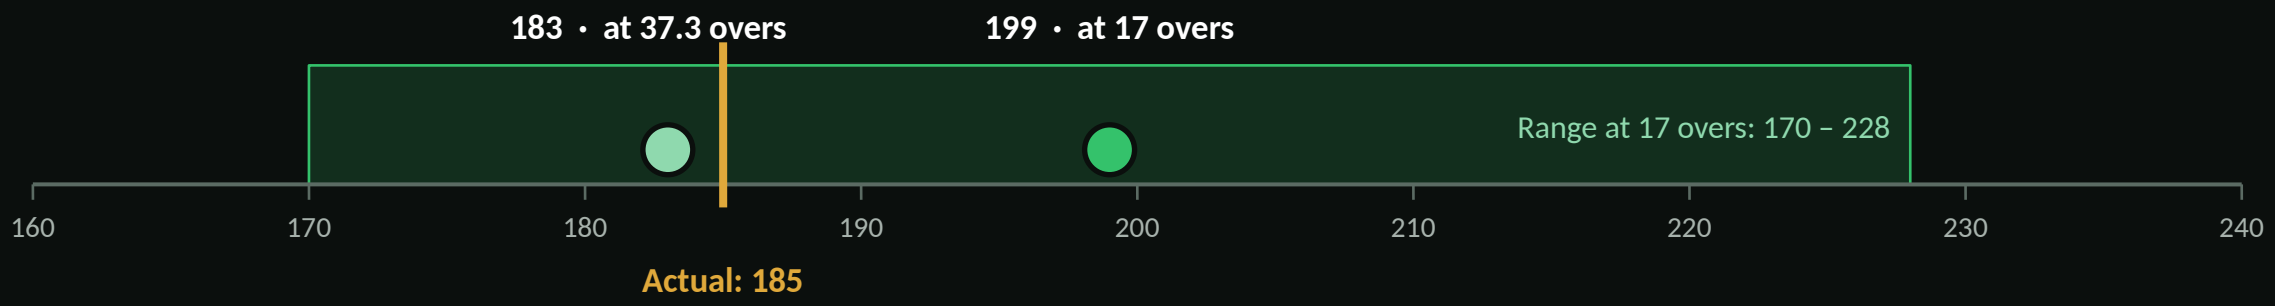

FINAL

Actual final score

185

Revised prediction was 2 runs away

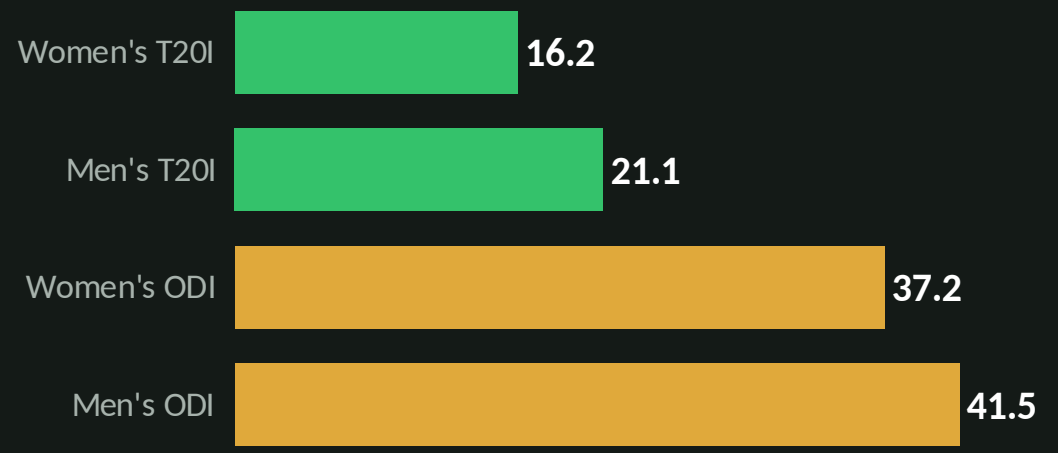

WHERE EACH ESTIMATE LANDED (FINAL SCORE, RUNS)

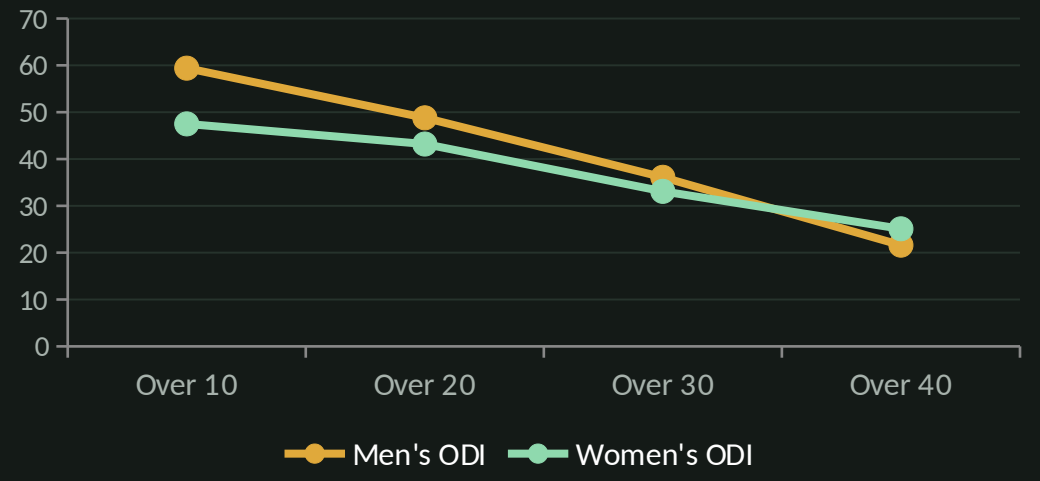

One match illustrates how the model behaves. It does not establish overall accuracy; see the 400-innings backtest on the next slide.

Testing predictions against real cricket

Average error in final score, by format (MAE, runs)

ODI error falls as the innings unfolds (MAE, runs)

400

first innings replayed

100 per format · 1,800 checkpoint predictions

WHAT MAE MEANS

The average gap, in runs, between predicted and actual final score. Roughly 13 to 16% of the average final score in each format.

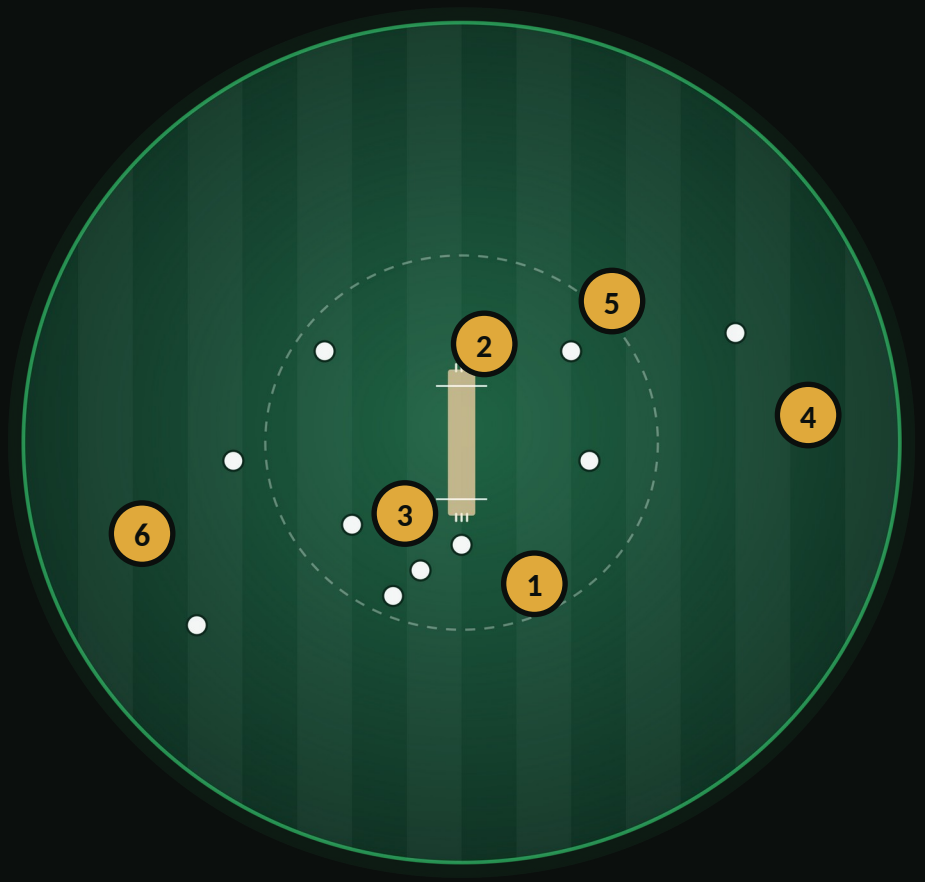

WHERE WE ARE HONEST

ODI score prediction is the biggest improvement opportunity. Death-over acceleration and other match-specific factors remain hard. Predicted ranges held the final score 47 to 56% of the time.

Historical replay of the current model on the 100 most recent eligible full-length internationals per format (Cricsheet); not an out-of-time holdout or independent validation. Run of 9 Nov 2026.

THE NEXT FRONTIER

What if we could quantify the impact of fielding?

TODAY IN CRICPREDICT

Fielding enters the model as one hand-assigned rating per team, for example India 0.92.

In our own backtest it does not improve run accuracy: MAE 27.8 with it, 27.3 without.

WHAT PUBLIC DATA SHOWS

Fielders are named only on successful dismissals. Dropped catches, misfields, direct hits and runs saved are not recorded.

FIELDING EVENTS THAT CAN MOVE SCORING, WICKETS AND TOTALS

1. Dropped catch
2. Missed run-out
3. Successful run-out
4. Boundary save
5. Misfield
6. Exceptional catch

The goal: measure the actual effect on runs, wickets and innings totals, not assign arbitrary fielding ratings.

MAE: approximate ablation of the fielding run modifier on 1,800 backtest checkpoint predictions. Field diagram is illustrative; marker positions are generic, not data.

FIELDING TODAY

Today's fielding rating: a prior, tested and bounded

WHY A PRIOR, NOT A MEASUREMENT

Public data cannot measure it. Ball-by-ball files name fielders only on successful dismissals: no drops, misfields, direct hits or runs saved.

Better data is paid. Event-level fielding data is sold under commercial licences. We use free sources only.

Outcomes are not skill. Catches and wickets alone cannot separate fielding from bowling and overall team quality.

WHAT IT IS AND DOES

A hand-assigned prior: one value per team, 0.71 to 0.94, in three tiers that follow overall team standing.

×0.90 – ×1.15
on projected runs

×0.79 – ×1.15
on projected wickets

Bounded. Unlisted teams are neutral.

HOW WE TESTED IT

Accuracy. Run MAE is 27.8 with it and 27.3 without. The best strength is about a quarter to a half of today's.

Observed outcomes. The ordering tracks catches and wickets per innings (rank correlation +0.3 to +0.7), which mostly reflects overall team quality. Runs conceded per over does not agree.

NEXT Label it an analyst estimate · Calibrate the effect size on held-out matches · Replace it with event-level evidence

Rank correlations use Cricsheet team outcomes for teams with 20+ innings (9 to 21 teams per cohort); approximate and confounded by team strength. MAE: ablation on 1,800 backtest checkpoints.

PROPOSED RESEARCH

Turning fielding events into predictive intelligence

1 Obtain event data — DATA

Structured historical fielding-event data from a partner.

2 Identify opportunities — DATA

Successful and unsuccessful fielding chances.

3 Attribute events — DATA

To players and match situations, where possible.

4 Quantify the influence — MODEL

Effect on runs, wickets and match outcomes.

5 Integrate what is validated — MODEL

Add only signals that prove predictive to the CricPredict framework.

6 Evaluate out-of-sample — TEST

Backtest on matches the model has not seen.

ALREADY BUILT · RESEARCH TOOLING, NOT IN PRODUCTION

Player registry and ingestion for public data, shadow-mode comparison against the live model, and an activation gate that blocks changes that do not improve held-out results.

THE MISSING INGREDIENT

Labelled events such as dropped chances, misfields, direct hits and runs saved. The framework is waiting for them; public data cannot supply them.

Proposed research, not a completed production feature. No fielding signal is in the live prediction today.

WHY CRICKETVIZ

An opportunity to take cricket analytics further

WHAT CRICKETVIZ MAY BRING

Domain knowledge, structured cricket information and data capabilities that could help investigate this problem.

I am not assuming what data you hold or can share. That is the first conversation.

WHAT I WOULD LIKE TO EXPLORE

- Ball-by-ball fielding events
- Dropped catches and missed opportunities
- Run-out attempts and outcomes
- Fielder attribution
- Runs saved or conceded
- Historical match coverage

PROPOSED FIRST STEP

Start small: a sample dataset and its data dictionary, so we can both see what is possible before any larger commitment.

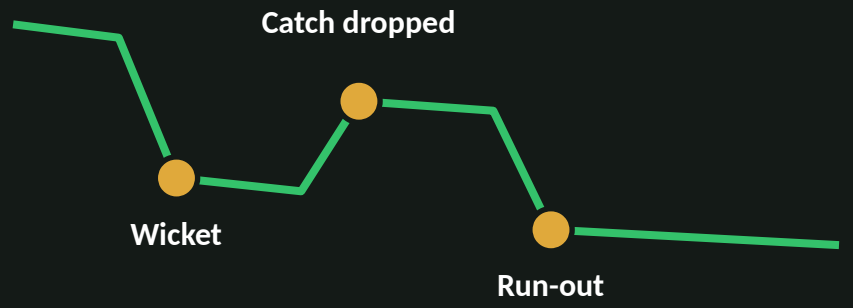

THE POTENTIAL VALUE FOR FANS

Making every moment of cricket more meaningful

- Understand why a prediction changes
- Appreciate the influence of individual fielding contributions
- Understand the importance of key match events
- Explore alternative match scenarios
- Gain insight beyond the conventional scoreboard

CONCEPT · ILLUSTRATIVE, NOT MODEL OUTPUT

How a prediction could be explained

Each event moves the projection, and the fan can see why.

COLLABORATION AND NEXT STEPS

Let's explore what's possible

1

Understand the data

What fielding data exists, how it is structured, and how far back it goes.

2

Explore a small-scale arrangement

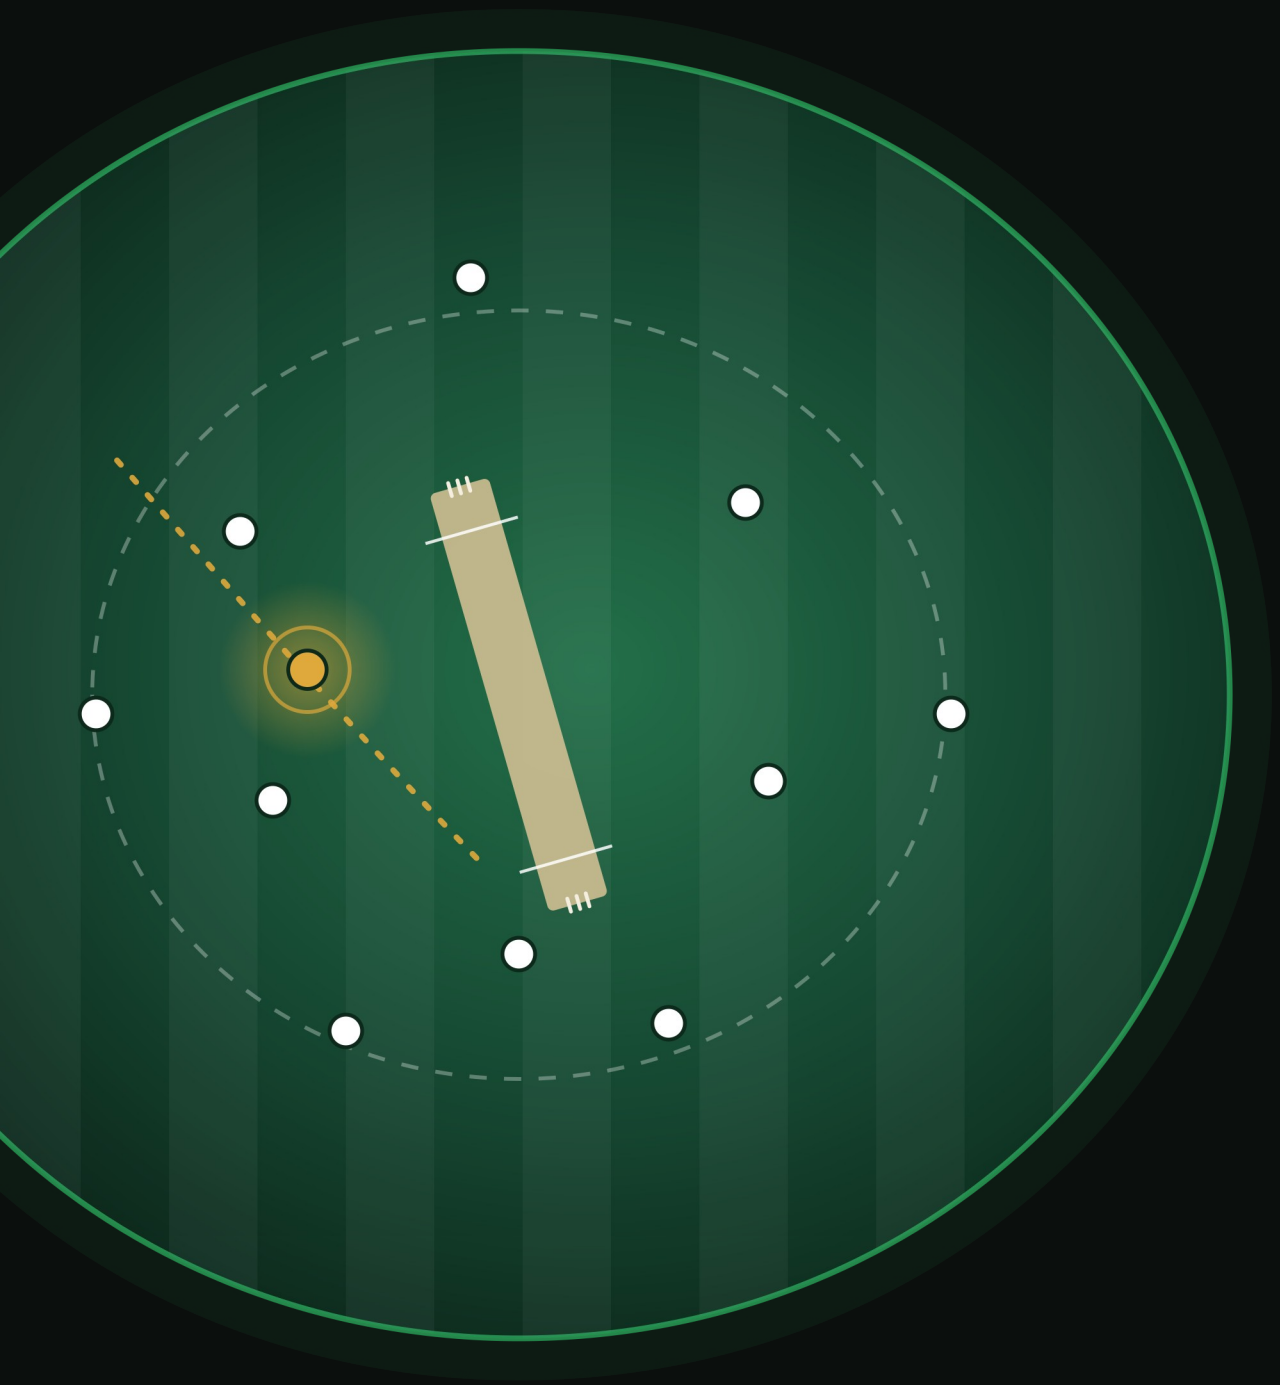

A limited data-sharing or research arrangement, starting with a sample.

3

Test whether it helps

Evaluate whether fielding information improves prediction accuracy on held-out matches.

These are points for discussion, not requests.

CRICPREDICT

Understand the game beyond the scoreboard

“I’m interested in exploring how better cricket data can help us build better predictions and give fans a deeper understanding of the game.”

Thank you, Cricketviz team.
